

The right connectivity, at the right price. Are you buying data efficiently for your taxi business?

There are many things that make your Taxi or Private Hire business a success.

The right drivers, the right cars and the best dispatch system all are critical, but there is an area that can be overlooked that brings all of those together and that is your mobile connectivity. Not only does this enable all the above to work in harmony, but it can also bring added value to your business. In the past, it has been difficult to get a premium connectivity service without adding significant cost, and despite what some providers might say not all SIM cards are equal.

Cheap taxi SIM cards have previously been exactly that, do not be fooled by buying a cheap taxi SIM card as it can end up costing you much more than you ever expected. When you take on a cheap taxi SIM card you are more than likely buying a SIM card that has been designed for consumer or business mobile use, or a mobile Broadband sim card. These will come with no sim management capability. On low-cost plastics that will undoubtedly have hidden charges and can be used in any device. They will probably connect to the public networks and not a private secure network which true IoT SIM cards work over, so they are much more likely to be hacked and misused and could be subject to data security breaches.

To make this right and keep you secure, always connected and at the right price All Communications are offering you the opportunity to switch to true IoT grade sim cards, running over a secure private network, giving you access to a sim management platform that will show you real time visibility of data usage, allow you to manage and label driver / cars for easy access and recognition of assets, allow you to have caps, alerts and bars in place, and the ability so full control your estate. But the best bit is this will all be available at a lower cost than most are paying for their current cheap consumer mobile SIM cards.

Not only will the All Communications SIMs help manage your costs, risks, and security but you can also keep drivers connected at all times with un-steered, multi-network IoT sims so you never miss a job again.

All our un-steered multi-network IoT grade SIM cards can also allow you to use SMS and Voice (if required) and we give you the ability to switch these services on and off at SIM level as and when required via your own dedicated SIM management portal.

As such they are ideal for dispatch systems like:

Another challenge with using mobile broadband and what appears to be a cheap data SIM is the fact that you are probably buying and paying for more data than you need. Taxi dispatch systems generally use only small amounts of data. So we offer a range of tariffs and solutions to meet your exact needs. With break points at:

<p>100MB</p> <p>Starting from £0.90 per SIM</p>	<p>250MB</p> <p>Starting from £1.40 per SIM</p>
<p>500MB</p> <p>Starting from £2.30 per SIM</p>	<p>1GB</p> <p>Starting from £2.80 per SIM</p>

Another key benefit is the fact that all your SIMs that are on the same tariff will benefit from data aggregation.

So, it does not matter how much data a single SIM uses, as long as you do not go over the aggregated pool amount there will be no additional charges.

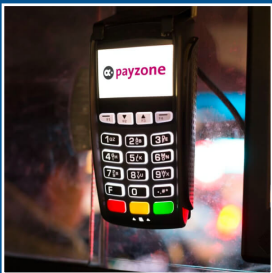

If none of the bundle sizes stated on the previous page work for you then that's not an issue, we offer a bespoke service where we will build exactly what you're looking for from your data estate.

"We offer a bespoke service where we will build exactly what you're looking for from your data estate."

VALUE ADDED SERVICES

Now that's taken care of your dispatch systems let's look at the added value services we can offer:

SIM cards for payment terminals

4G hotspots and Wi-Fi access, any amount of data at the right price with all the above security and management benefits

Forward-facing CCTV to cover your cab and your driver in the case of an accident

In-cab CCTV that will cover rear of cab and the passenger for additional security (soon to be legislation)

"With thousands of taxis already using All Communications connectivity in their cabs we have a trusted solution at a cost that will in most cases be lower than your existing service."
